Fact Sheet

Huntington’s Disease

Definition
Huntington's disease is a hereditary disorder of the central nervous system. Symptoms typically appear in adult life between the ages of 30 and 50. It is most often characterized by chronic progressive chorea and dementia without remissions.

Facts
It is estimated that 30,000 persons have Huntington's disease nationwide. Another 150,000 are at a 50 percent risk of inheriting the disease from an affected parent. The age of onset can range from age two to over age 80. The disease runs a relentless degenerative course over a period of 10-25 years. The patient eventually succumbs to complications such as heart failure or aspiration pneumonia.

Symptoms
An individual with Huntington's disease often has problems in three areas: control of bodily movements, intellectual functioning and emotional control. The intensity and number of the above symptoms, however, varies with each Huntington's disease patient.

Chorea--quick, jerking, uncontrollable movements of the limbs, trunk and face are the most obvious symptoms. The patient's gait is often mistaken for that of a person who is drunk.

Poor short-term memory and judgment--Although most patients continue to recognize their caregivers and can give feedback about their condition and care, the Huntington's disease patient suffers declining mental skills as the disease progresses.

Depression, irritability and apathy can be noted before and after the onset of chorea in a percentage of the Huntington's disease population. Some patients may exhibit schizophrenic-like behavior.

Diagnosis of Huntington's Disease
If there is a positive family history of Huntington's disease, the presence of an extrapyramidal movement disorder (when nerve impulses are not properly transferred to the muscles) is usually enough to confirm a diagnosis. Conventional neurological examinations and the presence of depression and other psychological disturbances are not enough to provide an accurate diagnosis.
The Huntington's Disease Gene and Genetic Testing

In 1993, after a ten-year search, scientists announced the discovery of the gene which causes Huntington's disease. This breakthrough has led to the development of a direct gene test for HD which can be used to predict the onset of Huntington's before symptoms develop. This test is more accurate and less complicated than the genetic marker test which has been in place since 1986.

The gene discovery shows the Huntington's disease is caused by a "genetic stutter"--a stretch of DNA repeated over and over at one end of a gene on Chromosome four. Efforts continue to determine precisely how this genetic mutation leads to the symptoms of the disease.

Contact local chapter or HDSA National Office for a list of testing centers. Progress is being made in other areas of research, too. Clinical drug trials are being conducted at 30 sites of the Huntington Study Group around the country.

Treatment

There is no cure for Huntington's disease. Medication can help the involuntary movements and emotional disorders for some Huntington's disease patients. Because of the strong emotional impact of the diagnosis and the stress of living with the knowledge that the children in the family may be at risk, family counseling and/or participation in support groups can be very helpful.

Del Mar Caregiver Resource Center supports and assists caregivers of brain-impaired adults through education, research, services and advocacy.

For residents of Central California, Monterey, Santa Cruz and San Benito Counties, Del Mar CRC provides direct family support services for caregivers of those with Alzheimer’s disease, stroke, head injury, Parkinson’s and other debilitating brain disorders that strike adults.
Family Caregiver Alliance supports and assists caregivers of brain-impaired adults through education, research, services and advocacy.

FCA's information Clearinghouse covers current medical, social, public policy and caregiving issues related to brain impairments.

For residents of the greater San Francisco Bay Area, FCA provides direct family support services for caregivers of those with Alzheimer's disease, stroke, head injury, Parkinson's and other debilitating brain disorders that strike adults.
